

Cheatsheets / Learn ReactJS: Part II

Lifecycle Methods

Component Mount

A React component mounts when it renders to the DOM for the first time if it's already mounted it can render again if it needs to change its appearance or content.

Mounting Lifecycle Methods

React supports three mounting lifecycle methods for component classes:

`componentWillMount()`, `render()`, and `componentDidMount()`. `componentWillMount()` will be called first followed by the `render()` method and finally the `componentDidMount()` method.
